

MISSION CONTROL UX

Restease

Extensive UX Research, Information Architecture, and Interaction
Flows for disaster response.

Designing for High-Stress Environments

In crisis scenarios, cognitive load is extremely high and decision-making time is minimal. The system must process complex multidimensional data (telemetry, weather, hardware diagnostics) and present only actionable vectors to the user.

Cognitive Load Reduction

Stripping non-essential UI. Using high-contrast color coding against a void background to instantly draw the eye to anomalies and active alerts.

Immediate Actionability

Metrics like ETA, distance, and hardware battery are nested directly within context maps and incident cards, eliminating deep menu navigation.

Who are we designing for?

Command Dispatcher

Base Camp Operations

THE GOAL

Maintain a holistic view of all deployed teams, receive distress signals instantly, and dispatch the closest available medical stretcher with zero friction.

USER STORIES

- **As a dispatcher**, I need SOS alerts to override all other UI elements so I don't miss critical events.
- **As a dispatcher**, I need the system to auto-calculate the live ETA and distance between rescue units.

Rajesh K.

Team Lead (NDRF Alpha)

THE GOAL

Navigate hazardous terrain safely, pair new hardware (stretchers/sensors) quickly in the field, and trust that telemetry is reaching base even with low connectivity.

USER STORIES

- **As a field responder**, I need an automated way to pair a smart-stretcher via NFC without manual data entry in the rain.
- **As a field responder**, I need to see the sync and battery status of my gear at a glance.

System Ontology & Data Map

Flow A: Critical SOS Dispatch

- User Action
- System Action
- Decision Point

Flow B: Hardware NFC Pairing

Empathy Through Efficiency.

By understanding the extreme cognitive demands placed on both field responders and command dispatchers, we've designed workflows that eliminate friction. Deeply mapping the Information Architecture guarantees that every data point—from battery life to GPS paths—has a deliberate, actionable purpose.
